Institute Elective-II

							Examination Scheme			
Sr. No.	Course Code	Course Name	L (hours)	T (hours)	P (hours)	Credits	Theory	Tutorial	Practical	Total Marks
1	PH 362	Basics Course on Relativity	3	0	0	3	100	0	0	100

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – V	L	T	P	C
PH301:Electromagnetics – II	3	1	0	4

Course Outcomes In the end of the semester students will able to:	
CO1	understand the concept of maxwell's equations and boundary conditions
CO2	explain the conservation laws in electrodynamics
CO3	examined the propagations of electromagnetic waves in vacuum and in matters
CO4	interpret the different potentials and gauge in electrodynamics
CO5	analyze the mechanism of electric and magnetic radiations
CO6	summarize the field of electrodynamics with relativity

Syllabus	
ELECTRODYNAMICS	(08 Hours)
Electromotive Force and motional emf, Faraday's law of Electromagnetic Induction and energy in the magnetic fields, Maxwell's Equations, How Maxwell Fixed Ampere's Law, Maxwell's Equations in Matter, Boundary Conditions	
CONSERVATION LAWS IN ELECTRODYNAMICS	(06 Hours)
The Continuity Equation, Poynting's Theorem, Newton's Third Law in Electrodynamics, Maxwell's Stress Tensor, Conservation of Momentum, Angular Momentum	
ELECTROMAGNETIC WAVES	(08 Hours)
Waves in One Dimension, Electromagnetic Waves in Vacuum and in Matter, Absorption and Dispersion in matter, Guided waves	
POTENTIALS AND FIELDS	(07 Hours)
Scalar and Vector Potentials, Gauge Transformations, Coulomb Gauge and Lorentz Gauge, Retarded Potentials, Jefimenko's Equations, Lienard-Wiechert Potentials, The Fields of a Moving Point Charge	
RADIATION	(06 Hours)
Electric and Magnetic Dipole Radiation, Radiation from an arbitrary source, Power radiated by a point charges, Radiation reaction	
ELECTRODYNAMICS AND RELATIVITY	(07 Hours)
Special theory of relativity and relativistic mechanics, Relativistic Electrodynamics, Field tensor, Electrodynamics in tensor notation.	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Introduction to Electrodynamics by David J. Griffiths, 3rd Edition, Pearson Education (2008).
2. Classical Electrodynamics, John David Jackson, 3rd Edition, Wiley (2018).
3. Elements of Electromagnetics by Matthew N. O. Sadiku, 6th Edition, Oxford university press, (2014).
4. The Classical Theory of Fields, Course of Theoretical Physics: Vol. 2 by L. D. Landau, E. M. Lifshitz, 3rd Edition, Pergamon Press (1967).
5. Field and Wave Electromagnetics by David K. Cheng, 2nd Edition, Pearson Education (2001).

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – V	L	T	P	C
PH 303 : Semiconductor Devices	3	1	0	4

Course Outcomes	
In the end of the semester students will able to:	
CO1	understand the working of various FET devices and their applications
CO2	understand the principle of operation of DIAC and TRIAC devices
CO3	identify the principle of operation and structure of SCR devices
CO4	interpret the concept of heterojunction devices and their applications
CO5	classify the characteristics of various photonic devices
CO6	examine the properties and applications of microwave devices

Syllabus	
VARIOUS FET DEVICES: INTRODUCTION, CHARACTERISTICS AND APPLICATION	(10 Hours)
Types of FET, JFET, MODFET, SIT, MOSFET, Structure and principle of operation of MOSFET, MOSFET as an amplifier, MOSFET analysis, Threshold voltage. Power MOSFET, HEMT.	
DIAC, TRIAC: INTRODUCTION, CHARACTERISTICS AND APPLICATION	(08 Hours)
Structure of DIAC, DIAC Principle of operation, Structure and principle of operation of TRIAC, Applications of TRIAC.	
PNPN: INTRODUCTION, CHARACTERISTICS AND APPLICATION	(06 Hours)
The silicon-controlled rectifier, Device structure, Principle of operation, Equivalent circuit. Applications.	
INTRODUCTION TO THE HETERO JUNCTIONS AND APPLICATIONS	(06 Hours)
Concept of Heterojunction, Multilayer Heterojunction, Energy band diagram for Heterojunction, Confinement of charge carrier, Application of Heterojunction.	
PHOTONIC DEVICES: INTRODUCTION, CHARACTERISTICS AND APPLICATION	(06 Hours)
Light Emitting Diode (LED), Characteristics of LED, Materials and wavelength of light, Laser diode, Structure, Characteristics of laser diode, Photodiode and solar cell.	
MICROWAVE DEVICES: INTRODUCTION, CHARACTERISTICS AND APPLICATION	(06 Hours)
MESFET, HEMT	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Schilling D.L. and Belove, C., Electronic Circuits : Discrete and Integrated, McGraw Hill, 1989
2. Streetman, B. & Banerjee S. Solid State Electronic Devices, Prentice Hall, 2005
3. Boylestad R.L. and Nahselsky, L. Electronic Devices and Circuit Theory, Prentice Hall, 2005
4. Liao S.Y. Microwave Devices and Circuits, Prentice Hall , 1996
5. Sze S.M. Semiconductor Devices : Physics and Technology, John Wiley & Sons, 1986

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – V	L	T	P	C
PH 305 : Atomic & Molecular Physics	3	1	0	4

Course Outcomes In the end of the semester students will able to:	
CO1	understand various atomic models and their importance
CO2	interpret one-electron systems and associated relativistic corrections
CO3	examine the effects of magnetic and electric fields on the spectral lines
CO4	analyze the quantum mechanical aspects of hydrogen and helium atom structure
CO5	understand the hartree theory and the idea of self-consistency
CO6	analyze the molecular structure by inspecting the rotational, vibrational and electronic transitions

Syllabus	
INTRODUCTION TO ATOMIC STRUCTURE AND MODELS	(05 Hours)
The nuclear atom, Electron orbits, Atomic spectra, The Bohr atom, Energy levels and spectra, Correspondence principle, Nuclear motion, Atomic excitations.	
ONE-ELECTRON ATOMIC SYSTEMS	(12 Hours)
Relativistic corrections of energy terms: relativistic mass correction, Darwin term, and spin-orbit term. Fine structure. Lamb shift. Hyperfine structure. LS & JJ coupling, Zeeman, Paschen-Bach & Stark effect, Introduction to time-dependent perturbation theory	
HYDROGEN ATOM	(08 Hours)
Limitations of classical mechanics, Schrodinger's time independent wave equation, Orbital angular momentum, parity of eigen functions.	
HELIUM ATOM	(06 Hours)
Spectrum of Helium, Quantum mechanical explanation of splitting of He terms, Ground state energy of He atom.	
HARTREE THEORY AND IDEA OF SELF-CONSISTENCY	(05 Hours)
Hartree's self-consistent field, Results of Hartree theory, Atomic orbitals and Hund's rule, The periodic table	
MOLECULAR STRUCTURE	(06 Hours)
General nature of molecular structure, Born–Oppenheimer separation, rotation and vibration of diatomic molecules, electronic structure of diatomic molecules	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Woodgate G. K., Elementary Atomic Structure - Oxford Uni. Press, 1983
2. Gillespie R. J. ,Atoms, Molecules, and Reactions: An Introduction to Chemistry Prentice Hall, 1994
3. Bransden B. H. and Joachaim C. J. , Physics of Atoms and Molecules, Benjamin Cummings 2003
4. Roy R. R. and Nigam B. P., Nuclear Physics: Theory and Experiment , John Wiley 1967
5. Preston M. A. and Bhaduri R. K., Structure of Nucleus, Addison-Wesley, 1975

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – V	L	T	P	C
PH307: Plasma Physics	3	1	0	4

Course Outcomes In the end of the semester students will able to:	
CO1	understand the basic properties and criteria for plasma
CO2	introspect the particle motions under the influence of external electric and magnetic field
CO3	analyze the electrodynamics and fluid equations for plasma
CO4	examine the diffusion and transport properties of plasma
CO5	classify the characteristics of plasma oscillations and plasma waves
CO6	understand the diagnostic method to study the plasma properties

Syllabus	
INTRODUCTION	(02 Hours)
General properties of plasma, Criteria for its existence, Occurrence in nature, Sources of plasma generation in laboratory, Applications, Concept of temperature in plasma.	
MOTION OF CHARGED PARTICLES IN ELECTRIC AND MAGNETIC FIELD	(08 Hours)
Uniform electric and magnetic field, Non-uniform magnetic field, Non-uniform electric field, Time-varying magnetic field, Time-varying electric field, Adiabatic invariant, Plasma confinement in laboratory, Summary of guiding centre drifts.	
PLASMA AS FLUID	(06 Hours)
Electrodynamics equations in plasma, Plasma dielectric constant, Fluid equations of motion, Fluid drifts in the presence of magnetic field.	
DIFFUSION AND TRANSPORT	(10 Hours)
Collision parameter, Diffusion parameter, Ambipolar diffusion, Recombination, Diffusion across a magnetic field, Collisions in fully ionized plasma, Plasma resistivity, The single-fluid MHD equations.	
PLASMA OSCILLATION AND WAVES	(10 Hours)
Overview of wave, Phase velocity and Group velocity, Plasma oscillations, Electron plasma waves, Sound waves, Ion waves, Comparison of electron and ion waves, Upper hybrid frequency, Lower hybrid frequency, Electromagnetic plasma waves, Cut-off and resonances.	
BASIC PLASMA DIAGNOSTICS USING ELECTRICAL METHOD	(06 Hours)
Debye shielding problem, Plasma sheath - physical mechanism, wall potential and inner structure, Plasma probe.	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Plasma Physics and Controlled Fusion by F. F. Chen, 2nd Edition Volume 1: Plasma Physics, Springer 2006.
2. Principles of Plasma Discharges and Material Processing by M. A. Liebermann and A. J. Lichtenberg, 2nd Edition, Wiley-Interscience 2005.
3. Fundamentals of Plasma Physics by J. A. Bittencourt, 3rd Edition, Springer 2004.
4. Introduction to Plasma Physics by R. J. Goldston and P. H. Rutherford, 1st Edition, CRC Press 1995.
5. Fundamentals of Plasma Physics by P. M. Bellan, Cambridge University Press 2012.

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – V	L	T	P	C
PH 361 : Basics of Astronomy and Astrophysics	3	0	0	3

Course Outcomes In the end of the semester students will able to:	
CO1	recall the basic understanding of the Astronomy and Astrophysics
CO2	understand the important concepts as applied to Astronomy and Astrophysics
CO3	apply the concepts learned to find the properties of Celestial objects and phenomena
CO4	analyze the results available in literature or those derived in the course
CO5	evaluate the limitations and robustness of the concepts as applied to Astronomy and Astrophysics

Syllabus	
UNIVERSE AND CELESTIAL BODIES	(18 Hours)
Matter vs Radiation Dominated universe, The early universe, structure formation, Galaxies, Nebulae, Stars, Classification of celestial bodies, other celestial objects.	
SOLAR SYSTEM	(10 Hours)
Birth, Life and death of a star, H-R diagram, Solar system & its members	
EARTH AND ITS ATMOSPHERE	(07 Hours)
Formation and structure of the Earth, different surface features of the earth, earth's Atmosphere and its different parts, radio window, ozone depletions	
SPACE EXPLORATIONS	(07 Hours)
Radiation in the universe, its effect on human and other non-living mechanisms, types Space vehicles, manned space explorations	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Degaonkar S. S., Space Science, Gujarat University Press, 1968
2. Patrick M., Atlas of the Universe, Cambridge University Press, 2000
3. Beiser A., Concept of the Modern Physics, TMH, 2008
4. Mukhanov, M., Physical Foundations of Cosmology, CUP, 2005.
5. Islam, J. N., An Introduction to Mathematical Cosmology, CUP, 2004.

Third Year of Five Year Integrated MSc (Physics)**M.Sc. – III, Semester – V****PH 363 Solar Cell Technologies**

L	T	P	C
3	0	0	3

1. Course Outcomes (COs)

In the end of semester the students will be able to:

CO1	Summarize the status of energy crisis and appreciate role of Solar PV
CO2	Understand the physics of semiconductor materials and junctions
CO3	Identify the designing aspects of solar cells and modules
CO4	Examine the silicon based solar cell technologies
CO5	Inspect the thin-film solar cell, concentrator solar PV technologies

2. Syllabus:

- **Energy Scenario and Solar Photovoltaics (PV)** (4 hours)
World energy requirement, review of renewable energy sources, economics and global energy market, role of solar PV, solar radiation as energy source, solar spectrum, Sun-Earth system, movements and radiation collection, sun-tracking, measurement of solar radiation.
- **Physics of Semiconductor Materials and Junctions** (8 hours)
Fundamentals of semiconductors, formation of energy bands, direct and indirect band gap, charge carriers in semiconductors, carrier concentration and distribution, density of energy states, carrier motion in semiconductors, electric field and energy band bending, generation & recombination of carriers, p-n junction: equilibrium condition, space charge region, p-n junction in non-equilibrium condition, p-n junction under illumination: solar cell, generation of photovoltage, light generated current, i-v equations of solar cells, solar cell characteristics.
- **Design of Solar Cells and Modules** (8 Hours)
Solar cell parameters, losses in solar cell, models of solar cell, effect of series, shunt resistance, radiation and temperature on efficiency, solar cell design, solar simulator, quantum efficiency measurement, minority carrier lifetime and diffusion length measurement, Solar PV modules for solar cells, mismatch in series and parallel connections, design and structure of PV modules, PV module power output.
- **Silicon Based Solar Cell Technologies** (8 Hours)
Growth of solar PV industry silicon, production of Si wafers, monocrystalline Si ingots: CZ and FZ processes, multicrystalline Si ingots, wafer dicing: ID and wire sawing, solar grade silicon, process flow of commercial Si cell technology, high efficiency Si solar cells.
- **Thin-Film Solar Cell Technologies** (5 Hours)
Advantages of thin films technologies, material for thin film technologies, use of TCO and light trapping, possible solar cell structure, substrate and superstrate configuration, thin film module manufacturing, amorphous Si solar cell technology, CdTe solar cell technology, CIGS solar cell technology, thin film Si based technologies.

● **Concentrator Solar PV and Other Emerging Solar Cell Technologies** **(8 Hours)**

Concentrator PV Cells, concentration ratio, optics for concentrator PV, tracking requirement of CPV, cooling requirements, minority carrier injections under high concentration, high concentrator solar cells, organic solar cell, dye-sensitized solar cell, perovskites solar cells, GaAs solar cells, thermophotovoltaics, need to go beyond current cell technologies

(Total Contact Time (Theory): 42 Hours)

BOOKS RECOMMENDED:

1. Solar Photovoltaics: Fundamentals, Technologies and Applications, Chetan Singh Solanki; (2015), PHI Learning Pvt. Ltd. Publication
2. Solar Cells: Operating Principles, Technology, and System Applications, Martin Green; (1983) Prentice Hall Publications
3. Thin Films Solar Cells, K. L. Chopra and S. R. Das; (1983), Springer Publications
4. Solar Cell Device Physics, Stephen Fonash; (2010), Academic Press Publication
5. Science and Technology of Photovoltaics, P. Jayarama Reddy; (2009), BS Publications

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – VI	L	T	P	C
PH302:Astrophysics and Space Science	3	1	0	4

Course Outcomes In the end of the semester students will able to:	
CO1	recall & understand the concepts of Astrophysics, and Space Science
CO2	analyse how astrophysical processes are studied, understood and utilized for furthering our understanding of the universe
CO3	apply the concepts of space science to different problems
CO4	evaluate the applications to various problems related to Astrophysics and Space Sciences
CO5	analyse the satellite system such as GPS, Galileo, IRNSS.

Syllabus	
Introduction to the course	(02 Hours)
Large Scale objects	(10 Hours)
Astrophysical objects of interests like Galaxies, stars, their Evolution, Clusters, techniques to study these objects	
Stellar objects	(10 Hours)
Types of stars, their properties. Evolution of stellar objects. The Sun, the standard model. Quiescent Sun, Disturbed sun.	
Solar Terrestrial Relationship	(08 Hours)
The quiet and disturbed solar features and their impact on space weather. Magnetosphere, Ionosphere, atmosphere	
Radio Wave Propagation through Ionosphere	(06 Hours)
Refraction, effect of the ionosphere on wave propagation. Quiet ionosphere, disturbed ionosphere. The effects on technological systems.	
Advanced topics of relevance	(06 Hours)
Global Navigational Satellite System like GPS, Galileo, IRNSS.	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Ratcliff, J. A., Introduction to ionosphere & Magnetosphere, Cambridge University Press. 1975
2. Hargreaves, J. K., The Solar Terrestrial Environment, Cambridge University Press 1995
3. Kievelson, M. J., Introduction to Space Physics Cambridge University Press. 1995
4. Lang, K. R. Sun, Earth and Sky Springer 2006
5. Basu Baidyabath, T. Chattopadhyay and S. N. Biswas, An Introduction to Astrophysics, PHI Learning Pvt. Ltd., 2018

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – VI	L	T	P	C
PH304:Mathematical Methods in Physics	3	1	0	4

Course Outcomes In the end of the semester students will able to:	
CO1	understand the basis of vector spaces, determinants and matrices to apply it for linear transformation
CO2	utilize the eigenvalues and eigenvectors
CO3	analyze the vectors with indices and extend it to understand the tensors and interpret the types and properties of tensors
CO4	solve the second order ODE including Bessel, Hermite, Legendre, Hypergeometric and Confluent Hypergeometric equations
CO5	interpret the Legendre polynomials and Bessel functions and relate their applications

Syllabus	
VECTOR SPACES	(06 Hours)
Subspaces, Basis and dimension, co-ordinates, row space, column space, nullspace	
LINEAR TRANSFORMATION	(10 Hours)
Representation of linear transformation by Matrices, rank-nullity theorem, duality and transpose, determinant, linear functional, dual space.	
EIGEN VALUES & EIGEN VECTORS	(04 Hours)
Minimal & characteristic polynomials, diagonalisations, Cayley Hamilton theorem.	
TENSOR ANALYSIS	(08 Hours)
Vectors and Indices: Transformation Properties of Vectors, Covariant and Contravariant Vectors; From Vectors to Tensors: Algebraic Properties of Tensors, Numerical Tensors; Metric Tensor: Index Raising and Lowering, Differentiation of Tensors: Covariant Derivative, Metric Connection.	
SOLUTIONS TO BESSEL, HERMITE, LEGENDRE, HYPER GEOMETRIC AND CONFLUENT HYPER- GEOMETRIC EQUATIONS	(04 Hours)
BESSEL FUNCTIONS AND THEIR APPLICATIONS	(04 Hours)
Bessel Function of the first kind, Orthogonality, Neumann functions, Modified Bessel's functions, Asymptotic Expansions, Spherical Bessel function.	
LEGENDRE POLYNOMIALS AND SPHERICAL HARMONICS	(06 Hours)
Generating Function, Recurrence relations, Orthogonality, Associate legendre functions, Spherical harmonics, Legendre functions of the second kind, Vector spherical harmonics.	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Hoffman, K. and Kunze, R., Linear Algebra, PHI, 1991
2. Lang, S., Introduction to Linear Algebra (Undergraduate text in Mathematics), Springer, 1986
3. Grinfeld, Pavel. Introduction to tensor analysis and the calculus of moving surfaces. New York: Springer, 2013
4. Riley, Kenneth Franklin, Michael Paul Hobson, and Stephen John Bence. Mathematical methods for physics and engineering: a comprehensive guide. Cambridge university press, 2006.
5. Hassani, Sadri. Mathematical methods: for students of physics and related fields. Vol. 720. Springer Science & Business Media, 2008.

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – VI	L	T	P	C
PH 306:Digital Electronics	3	1	0	4

Course Outcomes In the end of the semester students will able to:	
CO1	explain the basic concepts and terminology of number systems, binary codes and logic gates
CO2	interpret the basic relations of logic gates conversations by using Boolean algebra and Karnaugh maps
CO3	analyze various combination circuits, flip-flops and timing circuits
CO4	identify the basic principles of A to D and D to A conversions
CO5	to design and implement application-oriented digital circuits

Syllabus	
INTRODUCTION, NUMBER SYSTEM	(04 Hours)
Digital & Analog System, Logic Levels and Pulse Waveforms, Elements of Digital Logic, Functions of Digital Logic, Digital Integrated Circuits, The Decimal Number System, The Binary Number System, Representation of Signed Numbers and Binary Arithmetic in Computers, Different Number Systems.	
BINARY CODES & LOGIC GATES	(03 Hours)
Different Codes, and Gates, , Inhibit circuits, 7400 series ICs, ANSI/IEEE Standard Logic symbols, Pulsed operation of Logic Gates	
BOOLEAN ALGEBRA	(03 Hours)
Logic Operations, Axioms and Laws of Boolean Algebra, Duality, Reducing Boolean Expressions, Boolean Expression and Logic Diagrams, Converting AND/OR/Invert Logic to NAND/NOR logic, Determination of Output level from the diagram	
THE KARNAUGH AND QUINE-McCLUSKY METHODS	(06 Hours)
Expansion of a Boolean Expression to SOP & POS form, Computation of total Gate inputs, All variables K-map, Don't care combinations, Hybrid logic, Minimization of Multiple output circuits, Variable mapping, Quine-McClusky Method, Function minimization of multiple output circuits	
COMBINATION CIRCUITS	(06 Hours)
The Half- Full-adder -Subtractor, Parallel Binary Address, the look-ahead carry adder, IC parallel adders, Two's complement addition & subtraction using parallel Adders, serial Adders, BCD Adders, Binary multipliers, code converters, Parity generators/checkers, Comparators, IC Comparator, Decoders, BCD to seven segment decoders, Display devices, Encoders, Multiplexers, Demultiplexers and Applications	
FLIP-FLOPS AND TIMING CIRCUITS	(04 Hours)
The S-R latch, Gated latches, Edge-triggered Flip-Flops, Asynchronous inputs, Flip-flop operating	

characteristics, Master Slave (Pulse-triggered) flip-flop, Conversion of Flip-flops, Applications of Flip-flops, ANSI/IEEE Symbols, Schmitt Trigger, Multivibrators , crystal controlled clock generators.	
SHIFT REGISTERS , COUNTERS	(06 Hours)
Buffer register, Controlled Buffer register, Shift Registers & Data Transmission in shift register, Counters, Pulse Train Generators, Pulse Generators using shift registers, Cascading of Synchronous counters.	
LOGIC FAMILIES AND ANALOG-TO-DIGITAL AND ANALOG-TO-ANALOG CONVERTERS	(06 Hours)
Digital IC Specification Technology, Logic Families, Transistor Transistor Logic (TTL), Open – collector Gates, Digital-to-Analog(D/A) Conversion, The R-2R Ladder Type DAC, The Weighted – resistor Type DAC, The Switched Current-source Type DAC, Analog-to-Digital Conversion, The Counter-type A/D Converter, The Tracking-type A/D Converter, The Flash-type A/D Converter, The Dual-slop Type A/D Converter, The Successive-approximation Type ADC	
DESIGNING DIGITAL CIRCUITS	(04 Hours)
Reactor design, Traffic signal, Stepper mottor	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Floyd T. L, Jain R. P., Digital Fundamentals, Dorling Kindersley (India) Pvt Ltd 2008.
2. Morris Mano M. Digital Logic & Computer Design, Dorling Kindersley (India) Pvt. Ltd. 2008.
3. A. Anand Kumar, Fundamentals of Digital Circuits,Prentice-hall of India Pvt. Ltd. 2009.
4. Jain. R. P., Modern Digital Electronics, Tata McGraw Hill Publishing Company Ltd.2009.
5. Malvino A.P., Leach P. D., Digital Principals & Applications., Tata McGraw Hill Publishing Company Ltd. 2008.

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – VI	L	T	P	C
PH 308 : Nuclear Physics	3	1	0	4

Course Outcomes In the end of the semester students will able to:	
CO1	understand the concept of structure of nuclei, and simple nuclear models such as the liquid drop model and the shell model
CO2	explain the deuteron behavior at ground and excited states
CO3	understand the techniques in scattering theory which are relevant in nuclear physics
CO4	understand the differences between various decay modes, state selection rules, and determine whether a given decay can take place
CO5	the key features of nuclear fission and fusion and their applications

Syllabus	
Properties of Nuclei	(08 Hours)
Constituents of nucleus and their Intrinsic properties, quantitative facts about mass, radii, charge density, matter density and its experimental determination, binding energy, average binding energy, Packing fraction, BE/A vs. A plot, stability of nuclei (N Vs Z plot), angular momentum, parity, magnetic moment, electric moments.	
Nuclear Models	(08 Hours)
Liquid drop model approach, Weizsacker's semi-empirical mass formula and significance of its various terms, condition of nuclear stability, Mass parabolas -Prediction of stability against beta decay for members of an isobaric family, Stability limits against spontaneous fission. Fermi gas model (degenerate fermion gas, nuclear symmetry potential in Fermi gas), evidence for nuclear shell structure, nuclear magic numbers, basic assumption of shell model, Rotational spectra, concept of mean field, residual interaction, concept of nuclear force, Deuteron problem, Meson theory of nuclear forces.	
RADIOACTIVITY DECAY	(08 Hours)
Alpha decay: basics of α -decay processes, theory of α -emission, Gamow factor, Geiger Nuttall law, α -decay spectroscopy, decay Chains. B-decay: energy kinematics for β -decay, β -spectrum, positron emission, electron capture, neutrino hypothesis. Gamma decay: Gamma rays emission from the excited state of the nucleus & kinematics, internal conversion.	
INTERACTION OF NUCLEAR RADIATION WITH MATTER	(06 Hours)
Energy loss due to ionization (Bethe-Block formula), energy loss of electrons, Cerenkov radiation. Gamma ray interaction through matter (photoelectric effect, Compton scattering, pair production), neutron interaction with matter.	
NUCLEAR REACTIONS	(06 Hours)
Types of Reactions, Coulomb scattering (Rutherford scattering) Coulomb barrier, Conservation	

Laws, kinematics of reactions, Q-value, reaction rate, reaction cross section, Concept of compound and direct Reaction, Optical model, resonance reaction.	
NUCLEAR ENERGY(FUSION AND FISSION)	(06 Hours)
Introduction, Asymmetric fission -Mass yield, Emission of delayed neutrons, Nuclear energy release in fission, Nature of fission fragments, Energy released in the fission of U235, Fission of lighter nuclei, Fission chain reaction, Neutron cycle in a thermal nuclear reactor (Four Factor Formula), Nuclear power and breeder reactors, Natural fusion Possibility of controlled fusion.	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Introductory Nuclear Physics by Kenneth S. Krane (Wiley India Pvt. Ltd., 2008).
2. Nuclear Physics by S. N. Ghoshal, First edition, S. Chand Publication, 2010.
3. Nuclear Physics, S.B. Patel (Wiley Eastern Ltd.).
4. Nuclear Physics, D. C. Tayal (Himalayan Publishing House) 5th ed.
5. Basic Ideas and concepts in Nuclear Physics: An introductory Approach by K Heyde, Third edition, IOP Publication, 1999.

Additional Books:

6. Concepts of Nuclear Physics by Bernard L Cohen, Tata McGraw Hill Publication, 1974.
7. Radiation detection and measurement, G.F. Knoll, John Wiley & Sons, 2010.
8. Technique for Nuclear and Particle Physics experiments by William R Leo, Springer, 1994.

Third year of Five Years Integrated M.Sc.(Physics) M.Sc. – III, Semester – VI	L	T	P	C
PH 362 : Basic course on Relativity	3	0	0	3

Course Outcomes In the end of the semester students will able to:	
CO1	understand the concepts of special and general theory of relativity
CO2	analyse how relativistic processes are studied, understood and utilised for furthering our understanding of the universe
CO3	apply the concepts and theories to a range of problems related to relativity
CO4	approach and solve new problems in the range of relativity
CO5	evaluate and analyse the recent observations of objects/events

Syllabus	
INTRODUCTION TO THE COURSE	(04 Hours)
Inertial Frames, Universality of Newton's second law in all inertial frames, Classical Relativity, Does universal rest (ether) exists? Michelson Morley Experiment.	
SPECIAL THEORY OF RELATIVITY	(08 Hours)
Postulates of Special Theory of Relativity, Concept of transformation, Galilean Transformation, Simultaneity of two events in different inertial frames of reference and its frame dependence. Lorentz Transformation. Length Contraction and Time dilation with examples. Velocity Transformation, Relative velocity with examples, Time like and Space Like intervals, Causality.	
FOUR VECTORS	(06 Hours)
Need to redefine Momentum, Vector and Four-Vectors. Proper time interval, Velocity and Momentum-Energy Four Vector. Mass-Energy Relationship, Relationship between new energy and momentum.	
ELECTRODYNAMICS IN LIGHT OF RELATIVITY	(06 Hours)
Four Dimensional forms of Maxwell's equations. Four dimensional Vector Potential	
GENERAL RELATIVITY	(10 Hours)
Special and General Principle of Relativity, The Gravitational Field, The Equality of Inertial and Gravitational Mass as an Argument for the General Postulate of Relativity	
THE EXPERIMENTAL CONFIRMATIONS	(08 Hours)
Motion of the Perihelion of Mercury, Deflection of Light by a Gravitational Field, Displacement of Spectral Lines towards the Red, Gravitational Waves	
(Total Contact Time: 42 Hours)	

BOOKS RECOMMENDED:

1. Einstein A., Relativity: The Special And General Theory, Henry Holt And Company, 1920
